

1.2 编写 Python 程序实现功能：从键盘输入若干姓名，保存在字符串列表中；输入任意姓名，检索列表中是否存在。

程序代码

```
s = input("请输入姓名：")
names = s.split(" ")          #用" "切分字符串，split 函数切分，names 为列表
n = len(names)                #统计列表长度，len()函数
m = input("请输入查找姓名：")
for i in names:                #遍历列表。分两种情况：m 在 names 之内
    with names 之外
        if i ==m:
            print('列表中存在！')
        else:
            n = n-1            #根据 n 值判断 m 是否在 names 列表内。
            if n==0:            #若 m 不在 names 之内，n 值为 0
                print('列表中不存在！')
```

```
In [1]: runfile('C:/Users/HuaZi/.spyder-py3/temp.py', wdir='C:/Users/HuaZi/.spyder-py3')
请输入姓名：张三 李四 王五
请输入查找姓名：张三
列表中不存在！

In [2]: runfile('C:/Users/HuaZi/.spyder-py3/temp.py', wdir='C:/Users/HuaZi/.spyder-py3')
请输入姓名：张三 李四 王五
请输入查找姓名：赵六
列表中不存在！

In [3]:
```

2.1 “大润发”、“沃尔玛”、“好德”和“农工商”四个超市都卖苹果、梨、香蕉、桔子和芒果五种水果。使用 NumPy 的 ndarray 实现以下功能。

- (1)创建 2 个一维数组分别存储超市名称和水果名称；
- (2)创建 1 个 4×5 的二维数组存储不同超市的水果价格，其中价格由 4 到 10 范围内的随机数生成；
- (3)选择“大润发”的苹果和“好德”的香蕉，并将价格增加 1 元；
- (4)“农工商”水果大减价，所有水果价格减少 2 元；
- (5)统计四个超市苹果和芒果的销售均价；
- (6)找出桔子价格最贵的超市名称（不是编号）。

程序代码

```
#1
import numpy as np
names = np.array(['大润发','沃尔玛','好德','农工商']) #names 作为二维数组的行索引
fruits = np.array(['苹果','香蕉','橘子','芒果'])     #fruits 作为二维数组的列索引

#2
price = np.random.randint(4,101,size = (4,4))
print('超市水果价格为:') #采用 random 模块的 randint () 函数，生成 4~100 的随机整数
```

```
print(price)
```

```
#3
```

```
a = price[(names == '大润发')|(names == '好德')|(fruits == '苹果')|(fruits == '香蕉')]+1  
print('涨价后价格为:')  
print(a)
```

```
#4
```

```
b = price[names == '农工商']-2  
print('降价后价格为:')  
print(b)
```

```
#5
```

```
c = price[:,(fruits == '苹果')|(fruits == '芒果')].mean(axis = 0)  
print('均价为:') #axis = 0,按列处理。axis = 1, 按行处理。  
print(c)
```

```
#6
```

```
d = price[:,fruits == '橘子'].argmax() #argmax () 求最大值的索引  
print('桔子价格最贵的超市为'+names[d])
```

```
In [1]: runfile('C:/Users/HuaZi/.spyder-py3/temp.py', wdir='C:/Users/HuaZi/.spyder-py3')  
超市水果价格为:  
[[68 71 37 76]  
 [60 26 72 89]  
 [62 46 68 18]  
 [ 6 77 74 54]]  
涨价后价格为:  
[[69 47]  
 降价后价格为:  
[[ 4 75 72 52]]  
均价为:  
[49.    59.25]  
桔子价格最贵的超市为农工商
```

根据银行储户的基本信息，完成以下分析。

- 1) 从“bankpep.csv”文件中读取用户信息。
- 2) 查看储户的总数，以及居住在不同区域的储户数。
- 3) 计算不同性别储户收入的均值和方差。
- 4) 统计接受新业务的储户中各类性别、区域的人数。
- 5) 将存款账户、接受新业务的值转化为数值型。
- 6) 分析收入、存款账户与接收新业务之间的关系。

程序代码

```
import pandas as pd  
import numpy as np  
#1
```

```
bankpep_data = pd.read_csv('E:/bankpep.csv')
```

#2

#求储户总数

```
print(bankpep_data.count())
```

#求不同区域的储户数

```
print(bankpep_data.groupby('region')['id'].count())
```

#3

#计算不同性别储户收入的均值和方差。

```
print(bankpep_data.groupby(['sex']).aggregate({'income':['mean','var']}))
```

#4

#统计接受新业务的储户中各类性别、区域的人数。

```
print(bankpep_data.groupby(['sex','region'])['pep'].count())
```

#5

#将存款账户、接受新业务的值转化为数值型。

```
bankpep_data[['save_act','pep']] = np.where(bankpep_data[['save_act','pep']] == 'YES',1,0)
```

```
print(bankpep_data)
```

#6

```
print(bankpep_data[['income','save_act','pep']].corr().round(2))
```

 #保留两位小数

```

```

文件bankpep.csv存放着银行储户的基本信息, 请通过绘图对这些客户数据进行探索性分析。

```
import matplotlib.pyplot as plt
```

```
import pandas as pd
```

```
data = pd.read_csv('E:/bankpep.csv')
```

1.客户年龄分布的直方图和密度图

```
data['age'].plot(kind = 'hist',bins = 10,normed = True,title = 'Customer Age')
```

```
data['age'].plot(kind = 'kde',style = 'k-')
```

```
plt.xlabel('Age')
```

```
plt.ylabel('Density')
```

```
plt.show()
```

2.客户年龄和收入关系的散点图

```
plt.figure(figsize = (10,6)) #更改图片大小与背景
```

```
plt.scatter(data['age'],data['income'],marker = 's',s = 10) #s 设置点大小
```

```
plt.grid()
```

```
plt.title('Customer Income')
```

```
plt.xlabel('Age')
```

```
plt.ylabel('Income')
```

```
plt.xlim([0,80])
```

```
plt.legend(('(age,income)',)) #加“,”使图例显示完整
```

```
plt.show()
```

3.绘制散点图观察账户（年龄，收入，孩子数）之间的关系，对角线显示直方图

#3

```
pd.plotting.scatter_matrix(data[['age','income','children']],c = 'm') #c 用来设置颜色： m 为红紫色
```

```
plt.show()
```

4.按区域展示平均收入的柱状图，并显示标准差

```
import numpy as np
```

```
mean = data.groupby(['region']).agg({'income':np.mean})
```

```
std = data.groupby(['region']).agg({'income':np.std})
```

```
mean.plot(kind = 'bar',yerr = std ,rot = 45,title = 'Customer Income',legend = False,color = 'r')
```

```
plt.xlabel('Region')
```

```
plt.show()
```

5) 多子图绘制：账户中性别占比饼图，有车的性别占比饼图，按孩子数的账户占比饼图

```
sex_data = data.groupby(['sex'])['sex'].count()
car_data = data[data['car'] == 'YES'].groupby(['sex'])['sex'].count()
children_data = data.groupby(['children'])['children'].count()
fig = plt.figure(figsize = (7,6))
fig.add_subplot(221)    #221 可加可不加逗号
plt.pie(x = sex_data,labels = sex_data.index,startangle = 60,autopct = '%1.1f%%')
plt.title('Customer Sex')
plt.ylabel('sex')
fig.add_subplot(222)
plt.pie(x = car_data,labels = sex_data.index,startangle = 60,autopct = '%1.1f%%')
plt.title('Customer Car Sex')
plt.ylabel('sex')
fig.add_subplot(223)
plt.pie(x = children_data,labels = children_data.index,startangle = 60,autopct = '%1.1f%%')
plt.title('Customer Children')
plt.ylabel('Children')
plt.show()
```

6) 各性别收入的箱须图

```
data[['income','sex']].boxplot(by = 'sex',figsize = (6,6)) #by 为用于分组的列名
plt.show()
```
